

PRD — ShopBack Lens

Turning every social link, screenshot and question into a tracked ShopBack order.

Document owner	Wang Zhiming (王至明)
Version	1.1
Date	29 Sep 2026
Status	Proposal for review
Launch market	Singapore (M1–M9), Malaysia + Taiwan (M10–M12)
Time horizon	12 months
Read this first	The 17-slide deck is the primary submission. This PRD is the appendix.

How to read the numbers in this document. I do not have access to ShopBack's internal data. Every quantitative input is an explicit assumption, tagged [A-n], listed in §6 with the test that would confirm or kill it. Figures sourced from public material are tagged [P] and are directional only. Nothing in this document should be read as a forecast until [A-1], [A-4] and [A-8] have been measured.

1. TL;DR

ShopBack already has an answer engine: AI Assistant, Search by Photo, Smart Alerts, Travel Planner, a ChatGPT app, a browser extension. What it does not have is a capture surface for the journey that no longer starts at ShopBack.

Purchase decisions now happen inside TikTok, Instagram, Xiaohongshu and WhatsApp. By the time the user thinks "was there cashback on this?", the order is already placed at an untracked merchant session. ShopBack earns nothing, the user earns nothing, and the merchant paid full price for a customer ShopBack could have claimed.

ShopBack Lens is the missing capture layer. The user shares a product link, a screenshot or a sentence into ShopBack from the app they are already in. Lens resolves the product, computes **True Net Price** (listed price – stackable vouchers – cashback + shipping) across partner merchants, and returns a one-tap tracked checkout. Conversational Ask and Watch are components of that surface, not a rebuild of AI Assistant or Smart Alerts.

Underneath it sits **Smart Rates**: merchants fund an *additional* welcome / win-back budget on top of the published base rate, and pay ShopBack a platform fee for allocating that budget to new and lapsed customers with a holdout-verified incrementality report. Extra cashback is merchant-funded. ShopBack's new revenue is the platform fee plus take on recovered GMV. Users never see a rate below the public base.

The bet in one sentence: the cheapest incremental GMV available to ShopBack is not new demand — it is the demand ShopBack already influences but fails to capture.

2. What I am building

2.1 Product definition

ShopBack Lens is a capture-and-answer layer inside the existing ShopBack app. Two entry modes, one shared answer.

Mode A — Lens (the v1 headline). Zero typing. The user shares a URL, image or screenshot into ShopBack from any app via the OS share sheet. This is the capability ShopBack does not have today. Search by Photo and AI Assistant both require the session to already be inside ShopBack.

Mode B — Ask (component, not a rebuild). A persistent Ask bar on the home screen, using the same True Net Price card as Mode A. ShopBack's live AI Assistant already does conversational comparison; Ask exists so a Lens user who then wants to refine ("must arrive Friday") never has to leave the same surface. It is not a parallel AI product.

Shared surface — the True Net Price card.

```
True Net Price = Listed price
                - Stackable merchant / ShopBack vouchers
                - Cashback (published base + optional Smart Rate boost)
                + Shipping (if not free at this basket size)
```

Primary action: **Buy via ShopBack** (tracked deeplink). Secondary: **Watch** — reuse of the live Smart Alerts capability, attached to a Lens result so the user does not have to re-find the SKU.

2.2 Target users

Primary — "Social-first Deal Seeker" (SG, age 22–35). Already has ShopBack installed. Discovers products on TikTok Shop, Instagram, Xiaohongshu and in WhatsApp groups. Wants cashback — that is why the app is installed — but the discovery journey never starts in ShopBack, so they capture it inconsistently. They do not need to be sold on cashback. They need the friction removed. [A-2]

Secondary — "Considered Buyer" (SG, age 28–45). Researching a S\$200–S\$2,000 purchase. Currently runs a manual process across merchant apps, a price-comparison tab and a Telegram deal channel. High AOV, low frequency. Best served by Mode B as a follow-on to a Lens capture.

Tertiary — "Merchant Growth Manager" (B2B). Owns performance budget. Under CFO pressure to prove affiliate spend buys incremental customers. Buys Smart Rates because the holdout report is something they can take to a QBR. This user is why the feature is monetisable beyond recovered GMV.

Explicitly not the v1 target: users who have never installed ShopBack. Lens is a retention-and-capture product. Shareable result cards in M10–M12 are optional acquisition upside, excluded from the model.

2.3 Core use cases

UC-1 — TikTok Live handoff (hero). Jia Hui, 27, is watching a live selling a hair dryer at S\$189. She taps Share → ShopBack. Under two seconds: same SKU is S\$189 on TikTok Shop with 2.5% cashback (net S\$184.28), S\$179 on Lazada with a 6% welcome boost because she has never bought there (net S\$168.26), S\$205 at the official store with 8% (net S\$188.60). She taps Lazada. ShopBack gets an order it would have lost.

UC-2 — WhatsApp forward. A friend drops a product link. She pastes it into Lens before opening the merchant.

UC-3 — Screenshot. An Instagram ad with no usable link. On next app open, ShopBack offers to match the fresh screenshot. [A-5]

UC-4 — Refine in Ask. After a Lens result: *"must arrive before Friday."* Same card, tighter constraint. This is why Ask lives on the Lens surface rather than as a separate AI product.

UC-5 — Deferred purchase. Net price is not compelling today. She taps Watch. Eleven days later a merchant-funded win-back fires: *"Your watched item is S\$24 cheaper all-in."*

UC-6 — Merchant console. A merchant sets a S\$40,000 extra monthly budget, a S\$22 target cost per new customer, and a 12% maximum boost. Weekly report splits new / lapsed / existing and shows incrementality against a persistent holdout.

2.4 How it works

Capture. iOS Share Extension and Android share-sheet intent are the unlock — they are what make Lens work *outside* the app. In-app paste, clipboard-on-open (permissioned) and screenshot detection are fallbacks that survive a share-sheet policy change. [A-14]

Resolve. (a) Known merchant URL → parse product ID, highest confidence, no LLM. (b) Image → OCR + vision embedding against the catalogue. (c) Text → LLM extracts constraints, then retrieval. All three land on a canonical product ID from existing merchant feeds.

Price. Live price, stackable vouchers, published base cashback, plus a Smart Rate boost if this (user, merchant) pair is NEW or LAPSED and the merchant has budget left. Rank by True Net Price, never by commission.

Route. Tracked deeplink. If a merchant app breaks attribution, Lens routes through an in-app browser and says why.

Smart Rates. See §2.7. The extra cashback is a merchant-funded boost on top of the published base. ShopBack's new line is a platform fee for allocation and incrementality measurement.

2.5 Scope

v1.0 (by M7, Singapore): iOS + Android share capture; URL resolution for the top 20 SG merchants by GMV; screenshot / OCR; Ask as a follow-on on the same card; True Net Price; Watch wired to existing Smart Alerts; Smart Rates pilot with a hand-managed merchant cohort.

v1.5 (by M12): Smart Rates self-serve console; Malaysia and Taiwan; browser-extension parity so desktop capture matches mobile; shareable Lens result cards.

Out of scope: rebuilding AI Assistant or Search by Photo as separate products; in-Lens checkout; grey-market / non-partner merchants; a standalone Lens app; lowering any user's rate below the published base.

2.6 Product principles

- 1. Rank by what the user pays, never by what ShopBack earns.** Merchants buy a higher rate, which lowers net price and earns rank honestly. They cannot buy position.
- 2. Rates only ever adjust upward from the published base.** Personalisation is a welcome or win-back offer. Downward discrimination is a trust and, in some markets, a regulatory failure. Monitored in real time, zero tolerance.
- 3. Say "I don't know."** A wrong match is worse than no match. Below the confidence threshold, show candidates and ask. [A-5]
- 4. Answer in under 2 seconds or show progress.** Lens competes with tapping the original link. p95 time-to-first-answer is a launch gate.
- 5. Do not rebuild what already exists.** Capture is new. Ask, Watch, catalogue, attribution and the wallet are extensions of live ShopBack surfaces.

2.7 Smart Rates — where the money actually comes from

This section exists because three claims cannot be true at once: rates only go up, merchant spend is unchanged, and ShopBack's retained margin expands by cutting ACTIVE users. The last of those is not the design.

What the user sees. Published base rate is the floor. NEW and LAPSED customers may see a higher rate, labelled as a welcome or win-back offer, with a one-tap explainer of who funds it.

What the merchant buys. An optional extra acquisition budget (example: S\$40,000 / month) with a target CPA by customer state and a maximum boost. ShopBack allocates that budget to predicted-incremental customers. A persistent holdout is non-optional; the incrementality number in the console is read off it.

What ShopBack earns from Smart Rates. A platform fee of 71 basis points on GMV from participating merchants [A-16], charged for allocation and holdout measurement — the same shape as a managed-service or retail-media fee. Separately, extra cashback paid to shoppers is a pass-through of the merchant's boost budget. ShopBack does not fund the boost, and does not pay for it by reducing ACTIVE users below the published base.

What does not change. Existing affiliate commissions on the published base continue as today. ACTIVE customers keep the public rate. Merchant *base* spend is unchanged. Merchant *total* spend rises by the optional boost budget plus the platform fee — they are buying verified incrementality, which is the point.

v1 can ship as rules (NEW → boost to merchant max while budget remains, LAPSED → 50% of max, ACTIVE → base) and earn a model later.

3. Why this, and why now

3.1 The problem

Every ShopBack surface that makes money today — app home, extension, merchant directory, even the new AI tools — assumes the user decided to shop and then opened ShopBack. Discovery no longer works that

way. The path from "I want this" to "I bought this" is two taps inside TikTok or a chat thread, and it never passes a ShopBack surface.

The cashback is not declined. It is never claimed, by a user who has the app installed and wants the money. That is the recoverable pool: **demand ShopBack already influenced but failed to capture.** [A-1]

A second clock is running. General-purpose assistants are moving into shopping. ShopBack's ChatGPT app is the right move for that channel. It does not capture TikTok, Instagram or WhatsApp, which is where this region's product decisions actually start. If ShopBack is absent from those moments, it becomes a coupon utility the assistant routes around.

3.2 What already exists — and the gap Lens fills

Shipping Lens without naming the live stack would be proposing a product ShopBack has already partly built. The live stack is the reason Lens is feasible in 12 months. It is also the reason the headline cannot be "an AI shopping assistant."

Live today	Job it does	Gap that remains
AI Assistant	Conversational compare, cash savings in-app	User must already be in ShopBack
Search by Photo	Visual search, in-app	Same: in-app capture, not share-from-TikTok
Smart Alerts	Price watch and notify	No attachment to a social capture; becomes Watch inside Lens
Picked For You	Personalised home ranking	Ranking, not capture
Travel Planner (Jul 2026)	OTA compare, paste-link, Book	Travel only
ChatGPT app (Apr 2026)	Cashback inside ChatGPT	Different distribution; does not intercept TikTok / WhatsApp
Browser extension	Desktop checkout reminder	Misses mobile social commerce
ShopBack Pay + card-linked (SG)	In-store earning	Does not solve online social leakage
Receipts / Snaps (AU; Pay sunset Mar 2026 in AU/MY)	Offline frequency	Different job, different sales motion
ShopBack Plus	Paid higher rates	Already live; expanding it is not a 12-month impact bet

The gap in one line: ShopBack can answer once you are inside it. It cannot intercept the moment the product is seen. Lens is that intercept.

3.3 Why this beats the alternatives

Scoring is judgement, not measured data. The ordering is the point.

Option	Demand	12-month feasibility	Margin impact	Defensibility	Verdict
Lens + Smart Rates	High	High	High	High	Selected
Deeper in-app AI (Assistant / Photo / Alerts)	Medium	High	Low	Low	Improves a surface the leaky journey never visits
Card-linked on all online spend	High	Low	Medium	High	Already live in SG for in-store. Universal online card-link is a bank/network deal and still misses in-app social checkouts
Instant cashback at checkout	High	Medium	Negative	Low	Conversion is real; it is a balance-sheet decision, and it is copied overnight
Retail media network	Medium	Medium	Very high	Medium	Needs the intent graph Lens generates. The sequel
Receipt-scan in Singapore	Medium	Medium	Medium	Medium	Live in AU. Best frequency lever, but a new SG sales motion and a separate business
Expand ShopBack Plus	Low	High	Medium	Low	Already live. SEA willingness to pay is still the risk
Group-buy / social tiers	Low	Medium	Low	Low	Viral upside, gaming, diluted economics

The decisive argument: **every other option either already exists, asks the user to want something new, or cannot ship in 12 months. Lens asks them to do something they already want, from the app they are already in.**

Smart Rates is bundled because Lens alone grows volume at an unchanged take rate. The customer-state data Lens and the order ledger produce is what makes an incrementality product sellable. Ship one without the other and you get growth without a new revenue line, or a pricing product with no new reason for merchants to care.

3.4 Why the window is now

Three things are true in 2026 that were not in 2023: multimodal models can resolve a screenshot cheaply enough for production; share sheets are habit; merchants are under CFO pressure to prove affiliate incrementality. ShopBack has also just turned a corner on profitability (six consecutive profitable quarters, public) — the year should go to a capture problem with a killable assumption, not a new business line.

4. User experience

4.1 Primary flow — share sheet

1. User is in TikTok / Instagram / WhatsApp / Chrome. Taps native Share → ShopBack.
2. A lightweight sheet appears over the host app: "*Finding this for you...*" She has not left the live.
3. Under two seconds, the True Net Price card: matched product, best net price, framed against what she was about to do — **"S\$20.74 better than the link you shared."**

- Expand to compare every merchant, with the arithmetic visible and a "why this rate" explainer on any boost.
- Buy via ShopBack or Watch.** Sheet dismisses. Back to the live in under five seconds if she defers.
- On detected order, confirmation names the specific Lens capture. That chip is what teaches the habit.

4.2 Secondary flow — Ask

Persistent Ask bar on home, same True Net Price cards, two to four options with a one-line reason each. Follow-ups refine. Every card has Buy / Watch.

4.3 Edge cases

Situation	Behaviour
No confident match	Top three candidates, user picks. Never silently guess.
Product exists, no partner carries it	Say so. Offer Watch. Do not invent a worse alternative.
Matched, ShopBack is not cheaper	<i>"The link you shared is already the best price."</i> Still offer Buy via ShopBack so they do not lose the base cashback, plus Watch.
Merchant app breaks attribution	In-app browser, with a one-line why.
Price feed stale	Label indicative, refresh on tap.
Abusive usage	Soft daily cap; degrade to URL-only before blocking.

4.4 Merchant console

Set extra monthly budget, target CPA by state, maximum boost, SKU exclusions. Reporting splits new / lapsed / existing and an incrementality estimate from a persistent holdout. The holdout is the product. A number ShopBack cannot defend under audit is worse than no number.

5. Technical approach

Six services, sequenced so the riskiest assumption is tested first.

Catalogue. Canonical product entities from existing merchant feeds. Highest-effort, highest-risk: if two listings cannot be declared the same SKU, Lens has no comparison. Build starts here. [A-4]

Resolution. URL parsers first (deterministic, no LLM); vision + OCR; LLM only on the text path. Confidence tuned toward false negatives.

Pricing. Live price with a freshness SLA, existing voucher logic, published base rate, optional Smart Rate boost. Cached per product, never per (user, merchant) rate.

Smart Rates. Customer-state classifier from order history; constrained allocator under merchant budget and CPA caps; platform-fee billing on participating GMV. Rules in v1, model later.

Capture clients. Share extension / intent, paste, clipboard, screenshot. Small in code, large in store-policy review — legal review in Phase 0.

Attribution handoff. Existing tracking, extended for app-to-app, with automated canary orders.

Cost control. LLM only on image and text paths. URL should carry the majority of volume. Cost per resolution is a launch guardrail. [A-10]

6. Assumptions

Every number in §7 depends on these. Each load-bearing assumption has a test and a kill condition.

6.1 Context (public, directional)

ID	Assumption	Basis
[P-1]	ShopBack operates in 13 markets, with 20M+ annual active members, 20,000+ merchant partners, and about US\$5.5B GMV driven to partners	Public company and press materials, 2025–2026; directional only
[P-2]	Blended affiliate commission roughly 5–8% of GMV; ShopBack retains roughly 30–45% after user cashback; net take rate around 2.4%	Industry norms for affiliate cashback; replace with actuals on day one

6.2 Load-bearing assumptions

ID	Assumption	Value used	How I would test it	Kill condition
[A-1]	Leakage. Partner-merchant purchases by ShopBack users that never pass through a tracked session	60%	Panel of 500 SG users plus opt-in email-receipt ground truth	Below 30% — recoverable pool is too small
[A-2]	Share-sheet adoption. SG MAU who use Lens $\geq$ once per month by M12	22%	Staged rollout with holdout; organic vs prompted	Below 8% after onboarding work
[A-3]	Usage intensity. Submissions per Lens-active user per month	3.2	Beta measurement	Below 1.5 — novelty, not habit
[A-4]	Match rate. Submissions resolved to a confident product	78%	Offline eval on 2,000 real social links and screenshots <i>before</i> client code	Below 55% — re-sequence behind catalogue
[A-5]	Image path. Screenshot top-1 accuracy	$\geq 70\%$	Same eval, image subset	Below 50% — ship URL-only v1
[A-6]	Match → click-out	46%	Beta funnel	Below 20%
[A-7]	Click-out → order	9.5%	Beta funnel vs current ShopBack conversion	Below 4%
[A-8]	Incrementality. Lens-attributed orders that would not otherwise have been tracked	55%	10% user-level holdout, 8 weeks	Below 25% — cannibalisation
[A-9]	Smart Rates participation. Share of SG GMV from merchants who activate a budget by M12	35%	Sell a 10-merchant pilot in M6 before self-serve	Below 12% — justify Lens on capture alone
[A-10]	Cost per resolution	$\leq$ S\$0.02	Load test	Above S\$0.08 — restrict LLM paths
[A-11]	Retention lift. Extra tracked orders per Lens user per month, <i>outside</i> Lens	+0.015	Same holdout as [A-8]	No significant difference
[A-12]	AOV on Lens orders	S\$95	Beta vs current SG AOV	—
[A-13]	SG monthly active users	600,000	Internal (I do not have it). Public 20M+ is <i>annual</i> actives <i>globally</i> ; 600k is a single editable SG MAU input, not derived from [P-1]	—
[A-14]	Platform tolerance. TikTok, Meta and the app stores continue to allow share-out	Holds	Monitor; paste/clipboard fallback	Hard block roughly halves [A-2]
[A-15]	SG annual tracked GMV (Smart Rates base)	S\$400M	Internal. Not a share-down of US\$5.5B; a separate editable input	—

ID	Assumption	Value used	How I would test it	Kill condition
[A-16]	Smart Rates platform fee on participating GMV	71 bps	What merchants pay for allocation + holdout reporting. Extra cashback is a separate pass-through of their boost budget	Below 20 bps — fee is not worth the sales motion
[A-17]	Fully loaded annual team cost (10 eng, 1 DS, 1 design, 1 PM)	S\$2.6M	Standard SG loaded cost; payback sanity check only	—
[A-18]	MY + TW combined run-rate as a multiple of SG at M12 exit	3.2×	Relative e-commerce GMV and ShopBack footprint. Contributes almost nothing <i>inside</i> the 12-month P&L	—

6.3 What I am explicitly not assuming

I am not assuming Lens acquires new users in year one. I am not assuming ShopBack builds its own price crawler; v1 uses existing feeds. I am not assuming in-app checkout. I am not assuming users pay for Lens. I am not assuming merchant *base* commission spend falls. I am not treating public 20M annual actives as monthly actives.

7. Expected impact

7.1 Three mechanisms

1. Recovered leakage → new tracked GMV. Orders that would have happened untracked now carry ShopBack attribution. Highest confidence: no new demand required. This is conversion of *already-intended* purchases onto a tracked path, not a higher on-site conversion rate in the classical sense. [A-8]

2. Frequency → repurchase. Watch alerts give a reason to open ShopBack between purchases. Each successful capture teaches the habit. Medium confidence, and set deliberately low so it cannot double-count mechanism 1. [A-11]

3. Smart Rates → platform-fee revenue on participating GMV. Applies to the participating book, not only Lens-originated GMV. Extra cashback is merchant-funded pass-through and is not booked as ShopBack margin. [A-16]

7.2 Modelled outcome — Singapore, month-12 run-rate

Base case. **Arithmetic consequences of \$6, not a forecast.** Every total below *includes* the retention lift [A-11].

SG MAU		600,000	[A-13]
× Lens monthly adoption	22%	→ 132,000	[A-2]
× Submissions per user per month	3.2	→ 422,400	[A-3]
× Match rate	78%	→ 329,472	[A-4]
× Match → click-out	46%	→ 151,557	[A-6]
× Click-out → order	9.5%	→ 14,398	orders/month
× Incrementality	55%	→ 7,919	incremental tracked orders/month
× AOV	S\$95	→ S\$752k	incremental GMV/month [A-12]
Annualised Lens-direct GMV		≈ S\$9.03M	
+ retention lift [A-11]		≈ S\$2.26M	
Total incremental GMV		≈ S\$11.28M	
× 2.4% net take		≈ S\$271k	Lens net revenue [P-2]
 Smart Rates platform fee:			
SG tracked GMV		S\$400M	[A-15]
× participation	35%	→ S\$140M	[A-9]
× 71 bps platform fee		≈ S\$994k	[A-16]
Combined SG M12 net revenue		≈ S\$1.26M	

Against S\$2.6M of fully loaded team cost [A-17], **year one does not pay the team back**. That is expected. Year one buys a run-rate; year two collects it. Malaysia and Taiwan launch in M10–M12 and contribute almost nothing inside the window, but they take the M12 *exit* run-rate to roughly **S\$4.0M** [A-18]. That is the number the investment decision should be made against — not year-one P&L, and not a claim that the conservative case "pays for itself."

7.3 Scenario range

Four uncertain inputs varied; everything else at base. Incremental GMV and net revenue **include retention lift**, so this table matches §7.2.

	Conservative	Base	Aggressive
Lens adoption [A-2]	10%	22%	35%
Match rate [A-4]	62%	78%	88%
Incrementality [A-8]	35%	55%	70%
Smart Rates GMV participation [A-9]	15%	35%	55%
Incremental GMV, annualised (Lens + retention)	S\$3.1M	S\$11.3M	S\$24.2M
Total net revenue, SG	S\$0.50M	S\$1.26M	S\$2.14M
M12 exit run-rate, 3 markets	S\$1.6M	S\$4.0M	S\$6.9M

The argument is the asymmetry, not the base case. Conservative still produces a S\$0.50M SG run-rate and a S\$1.6M three-market exit run-rate — it does **not** cover S\$2.6M of team cost in year one. Aggressive changes the shape of the funnel. Fund it if you believe [A-1] and [A-4] will clear their Phase 0 gates; kill it in month one if they do not.

7.4 Metrics

North Star: incremental tracked GMV per monthly active user. Target at base: **+\$1.57 / MAU / month** (S\$11.28M / 12 / 600,000). Chosen over "Lens usage" (inflatable) and plain GMV (rewards cannibalisation). Forces the holdout to stay in place.

Input metrics (weekly, product): share-extension install rate; Lens MAU / total MAU; submissions per Lens user; match rate by URL / image / text; time-to-first-answer p50 / p95; match → click-out; click-out → order; Watchlist alert → return rate.

Business metrics (monthly, leadership): incremental orders and GMV from the holdout; net revenue per Lens user; Smart Rates participating GMV and platform-fee revenue; new and lapsed customers delivered.

Guardrails (breach blocks further rollout): false-match rate $\leq 3\%$; cost per resolution $\leq$ S\$0.02; time-to-first-answer p95 $\leq 2.5s$; user-facing rate never below published base (automated, zero tolerance); merchant churn no worse than baseline; support contacts per 1,000 Lens sessions flat or falling.

Counter-metric: tracked orders per user in the *non-Lens* cohort. If Lens is creating value this stays flat while the Lens cohort rises. If it falls, Lens is redistributing.

7.5 Validation plan

A randomised 10% of SG users never receive Lens for the first eight weeks; a smaller permanent holdout persists all year. Every \$7.2 claim is read off that comparison. Smart Rates is validated with merchant-level switchbacks plus a user-level holdout inside participating merchants, so the number sold to merchants is defensible under audit.

8. Roadmap

Phase	Window	Deliverable	Gate
0 — De-risk	M0–M1	Offline resolution eval on 2,000 real social links/screenshots; leakage survey; concierge test (WhatsApp number, human does Lens for 100 users)	[A-1] $\geq 30\%$ and [A-4] $\geq 55\%$
1 — Alpha	M2–M3	URL-only Lens, top 8 SG merchants, Android share sheet + in-app paste. 5,000-user closed beta	[A-6] and [A-7] in range; p95 $< 2.5s$
2 — Beta	M4–M5	iOS Share Extension, image/OCR, Watch on existing Smart Alerts. 20% SG with 10% holdout	[A-2] trending; guardrails green
3 — GA + monetise	M6–M7	Ask follow-on; 100% SG; Smart Rates pilot, 10 hand-managed merchants	Pilot merchants renew; incrementality read is credible
4 — Scale fee	M8–M9	Smart Rates self-serve console with incrementality reporting	[A-9] trending to 35%
5 — Expand	M10–M12	Malaysia and Taiwan; extension parity; shareable result cards	SG unit economics on a path to cover run-rate

Catalogue eval happens before any client code. It is the assumption most likely to be wrong and the most expensive to discover late.

9. Risks

Risk	Severity	Mitigation
Catalogue cannot match SKUs across merchants [A-4]	Critical	Phase 0 gate. Fallback: same-merchant-only comparison, which still recovers leakage
TikTok / Meta block share-out [A-14]	High	Paste and clipboard paths, which no platform can block
Lens cannibalises rather than creates [A-8]	High	Permanent holdout; North Star defined so cannibalisation cannot look like growth
Merchants refuse the platform fee [A-9]	High	Pilot-sell in M6 before self-serve. If it fails, Lens is re-justified on capture alone
Reviewers read Lens as a rebuild of AI Assistant	High	Scope principle 5; Ask and Watch are components; share-sheet is the headline
Wrong match causes a bad purchase	Medium	False-negative-biased thresholds; visible "report a wrong match"
LLM cost outruns revenue [A-10]	Medium	URL path has no inference; daily caps; cost is a launch guardrail
Store rejection over clipboard / screenshot	Medium	User-initiated, permission-gated; legal review in Phase 0
PDPA exposure from shared images	Medium	Process transiently; no retention by default
Fast-follow by another cashback app	Low	Defensible assets are the catalogue, customer-state data and merchant budgets

10. Open questions

1. What is the measured leakage rate? [A-1] decides whether this is a S\$3M or a S\$24M GMV project.
2. How complete is the merchant product feed at SKU level, and how fresh is pricing?
3. Do current contracts allow a platform fee plus a merchant-funded boost, or does Smart Rates need re-papering?
4. Is Singapore the right first market, or does Taiwan's social-commerce mix produce a cleaner read on [A-2]?
5. What engineering capacity is actually available? The model assumes ~10 engineers, one data scientist, one designer, one PM.
